Ul-CF-EC1 is a normalized cDNA library containing the following tissue(8): Normal lung from adult and from fetal day 64, day 87, week 19 and week 42. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I; and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag

/nCI CGAP FH0 is a CDNA library containing the following tissue(s): Human Grade 1 Chondrosarcoma Cell Line The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an BcoR I adaptor, digested with Not I, and cloned directionally into PT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is AGAATCCGGC. The cell line was provided by Dr James Martin from University of Towa mac Tresme-Human Chondrosarcoma Cell line GRN - Grade 1
   cDNA Library preparation: Dr. M. Bento Soares, University of Iowa DNA Library Arrayed by: Dr. M. Bento Soares, University of Iowa DNA Sequencing by: M. Bento Soares, University of Iowa Clone Distribution: Clone distribution information can be obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TAG TISSUE=Human Chondrosarcoma Cell Line CS8 - Grade 1

/modified polylinker; Site_1: EOR I; Site_2: Not I;
/modified polylinker; Site_1: EOR I; Site_2: Challenged with different treatments. The library was normalized according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand CDNA synthesis was primed clowA was ligated to an EOR I adaptor, Double stranded cDNA was ligated to an EOR I adaptor, digested with Not I, and cloned directionally into prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GGCCATGCCG. The tissue was provided by Dr. Gary W. TAG_LIB=UI-H-FTI

NCI_CGAP_DH1 is a normalized cDNA library containing the following tissue(s): VS-8 Cell line from Metastatic Chondrosarcoma in Lung. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-pac vector. The oligonucleotide used to prime the synthesis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               628 bp mRNA linear EST 26-MAR-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 1, Application US/09069023A

Patent No. 6348573

GENERAL INPORMATION:

APPLICANT: Nunez, Gabriel

APPLICANT: Inohara, Nachiro

APPLICANT: Inohara, Nachiro

APPLICANT: Inohara, Nachiro

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR IDENTIFYING APOPTOSIS

TITLE OF INVENTION: SIGNALING PATHWAY INHIBITORS AND ACTIVATORS

FILE REFERENCE: UM-03333

CURRENT APPLICATION NUMBER: US/09/069,023A

CURRENT FILING DATE: 1998-04-27

NUMBER OF SEQ ID NOS: 38

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 1

LENGTH: 531
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   324

US-09-069-023-6
; Sequence 6, Application US/09069023A
; Patent No. 6348573
; GENERAL INFORMATION:
; APPLICANT: Nunez, Gabriel
; APPLICANT: Nunez, Nachiro
; APPLICANT: Noseki, Takeyoshi
; TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR IDENTIFYING APOPTOSIS
; TITLE OF INVENTION: SIGNALING PATHWAY INHIBITORS AND ACTIVATORS
; TITLE REFERENCE: UM-0333
; CURRENT APPLICATION NUMBER: US/09/069,023A
; CURRENT FILING DATE: 1998-04-27
; NUMBER OF SEQ ID NOS: 38
; SOFTWARE: PATENTIN Ver. 2.0
; SEQ ID NO 6

Application US/09245281

Patent No. 6369196

GENERAL INFORMATION:

APPLICANT: BETTIN ON SETTING TITLE OF INVENTION:

TITLE OF INVENTION: NOVEL MOLECULES OF THE CARD-RELATED PROTEIN FAMILY

TITLE OF INVENTION: AND USES THEREOF

FILE REFERENCE: 07334/118001

CURRENT APPLICATION NUMBER: US/09/245,281

CURRENT FILING DATE: 1999-02-05

EARLIER FILING DATE: 1998-12-08

EARLIER PELICATION NUMBER: US 09/207,359

EARLIER PELICATION NUMBER: US 09/099,041

EARLIER PELICATION NUMBER: US 09/099,041

EARLIER FILING DATE: 1998-06-17

EARLIER FILING DATE: 1998-02-06

NUMBER OF SEQ ID NOS: 44

SEQUENCE: FARESEQ for Windows Version 4.0

This sequence is a fragment of the human RICK (RIP-like interacting CLARP kinase) protein of the invention. RICK acts as a positive regulator of apoptoeis, potentiating apoptosis induced by caspase-8 and caspase-10 during CD95 signalling pathway inhibitors and activators, and methods and compositions for screening compounds which will modulate the interactions of the various compositions identified: ARC, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-I). RICK, is useful in screening cassays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CLARP can be used in during screening assays to identify inhibitor molecules blocking CD95-mediated apoptosis. Overexpression of ARC in an in vitro cell system can be used to identify inhibitory compounds may be useful for gene therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to treat e-g. cancer, AIDS, neurodegenerative disorders, aplastic anemia, ischaemic injury, and toxin-induced liver disease. Antirick antibodies can be used as reagents for the preparation or affinity chromatography
                                                                                                                                                                                                                                                                                                                                                                               RICK; human, RIP-like interacting CLARP kinase; apoptosis regulator; ARC; caspase-8; caspase-10; CD95 signalling; apoptosis signalling pathway; CIDE-8; DREP-1; diagnosis; cell growth; apoptosis dysregulation; gene therapy; cardiac disorder; eurodegenerative disorder; AIDS; aplastic anaemia; ischaemic injury; toxin-induced liver disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Compositions for identifying apoptosis signaling pathway inhibitors

```
for diagnostically measuring RICK levels. A specific inhibitor
                         of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intracellular factors such as CLARP and FADD appears to be essential for apoptosis, inhibitors of RICK binding to intracellular apoptosis are potential drug candidates. Note: This sequence was created using information given in the specification

Compositions for identifying apoptosis signaling pathway inhibitors useful for treating diseases

Claim 6; Page; 93pp; English

ALT This sequence is a fragment of the human RICK (RIP-like interacting CLARP kinase) protein of the invention. RICK acts as a positive regulator of apoptosis, potentiating apoptosis induced by caspase-8 and capase-10 during CD95 signalling apoptosis induced by caspase-8 and capabase-10 apoptosis signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for soreening compounds which will modulate the interactions of the various compositions identified: ARC, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREH-1). RICK is useful in screening assays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CLARP can be used in drug screening assays to identify inhibitor molecules blocking CD95-mediated apoptosis. Overspression of ARC in an in vitro cell system can be used to therapy treatment of disease with increased cell dark in muscle tissue can candiac disoaders. Therapeutic compositions of CIDEs can be used to treat e.g. cancer, AIDS, neurodegencrative disorders, aplastic anaemia, ischaemic injury, and toxin-induced liver disease. AntiRICK antibodies can be used as reagents for the preparation or affinity chromatography media, and for diagnostically measuring RICK levels. A specific inhibitor of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intracellular factors such as CLARP and PADD appears to the essential for apoptosis, inhibitors of RICK binding to intracellular apoptosis factors are potential drug candidates. Note: This sequence was compared using information given in the specification

This sequence is the invanion. The RICK (RIP-IIRE INCERECTING CLARY KIDBER)

C protein of the invention. The RICK protein acts as a positive regulator during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compounds which will modulate the interactions of the various compositions identified: RRC, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DRED-I). RICK is useful in screening cassays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of capoptosis. Complexes containing RICK and CLARP can be used in drug screening assays to identify inhibitor molecules blocking CD95-mediated apoptosis. Overexpression of ARC in an in vitro cell system can be used to identify inhibitors of the enzymatic activity of caspase-8.

C apoptosis. Overexpression of ARC in an in vitro cell system can be used to therapy treatment of disease with increased cell death in muscle tissue and cardiac disorders. Therapeutic compositions of CIDEs can be used to treat e.g. cancer, AIDS, neurodegenerative disorders, aplastic anaemia, caphary, and toxin-induced liver disease. Antifick antibodies can be used as reagents for the preparation or affinity chromatography media, and for diagnostically measuring RICK levels. A specific inhibitor contential step in the biochemistry of apoptosis is needed. RICK intraaction with intracellular factors such as CLARP and FADD appears to be essential for apoptosis, inhibitors of RICK binding to intracellular good appetosis factors are potential drug candidates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 394
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    324

                                                                                           New B1 protein regulates cell death and cell survival pathways - derivatives, DNA and antibodies, also regulate intracellular inflammation ; for treating AIDS, cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes the isolation of a novel human B1 protein which can interact with, intracellular mediators or modulators of inflammation, cell death and/or cell survival pathways, directly or indirectly. Cells can be modulated or mediated in inflammation, cell death or cell survival pathways or another intracellular signalling activity using B1. Conditions such as AIDS and cancer can be treated using B1. Antibodies, or allognucleotides and ribozymes can also be used to regulate the above
                                                                                                                                                                                                                                                                                                                                                                              B1 protein; intracellular mediator; modulator; inflammation; cell death; cell survival pathway; intracellular signalling; AIDS; cancer; human.

ANY68769-95 and AAY68797-99 represent human phosphorylation effectors (PHSP), designated PHSP1-PHSP31 (the protein sequence for PHSP28 is not given in the specification). The sequences were isolated from cDNA libraries prepared from various human tissues. The PHSP proteins are useful for the diagnosis, treatment and prevention of proliferative disorders, immune disorders and neuronal disorders. The PHSP proteins form pharmaceutical compositions which useful for treating or preventing disorders associated with decreased PHSP expression/activity. PHSP antagonists are useful for treating or preventing disorders associated with increased PHSP expression/activity.
                                                                                                                                                                                                                                                                                                            TTACAGAGTGTTTCAAGTGCCATTCACCTATGTGACAAGAAGAAATGGAATTATCTCTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for Synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention. Note: The Sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AACATACCTGTAAATCATGGTCCACAAGAGGAATCATGTGGATCCTCTCAGCTCCATGAA 454

              The present invention relates to a new method for identifying compounds for treating and/or preventing cytomegalovirus (CMV) infection and/or related diseases. The method of the invention comprises contacting a test compound with at least one of the cellular kinases RICK, RIP, NCk-Interacting kinase, MKK3 and SERK-2 and detecting any change in kinase activity. The method of the invention can be used to treat and/or prevent CMV infections and related diseases. Oligonucleotides that can detect the specified kinases can also be used for diagnosis of infection. The present amino acid sequence represents the human cellular kinase RICK protein of the invention, as described above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                513

The invention relates to antisense compounds targetted to a nucleic acid encoding human receptor interacting protein (RIP)2 to inhibit its expression. Antisense compounds are used for treating diseases associated with RIP2 expression. They are also useful in antisense gene therapy. The present sequence is human RIP2 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid

tissues and cells the genes are expressed in. Example of activities includes cytostatic; proliferative; vulnerary; immunomodulator; contidiabetic; antiachmatic; antitarbuticic; antiathmatic; coagulant; coagulant; cootropic; vasotropic; antiporatic and antiangiogenic. The motionic and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Complymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ crejection, modulate haemostatic or thrombolytic activity, modulate confinemation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-09-771-161A-2 (1-1669) x AAB43570 (1-544)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 544 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated polypeptide which is a human kinase and phosphatase (KPP). The KPP polypeptides, polynucleotides, agonists and antegonists are useful for diagnosing, treating or preventing cell proliferative disorders such as atherosclerosis, cirrhosis, hepatitis and cancer, developmental disorders e.g. mental retardation, neurological disorders including Alzheimer's disease and Parkinson's disease, autoimmune and inflammatory disorders such as Crohn's disease and diabetes mellitus and finally, viral, bacterial, fungal, parasitic, protozoan or helminthic infections. Furthermore, the

                                                                                                                                                                                                                                                          6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is a tragment or the number RICK acts as a positive regulator of during Objection of the invention. RICK acts as a positive regulator of apoptosis, potentiating apoptosis induced by caspase-8 and caspase-10 during CD95 signalling. The invention provides methods for identifying apoptosis signalling pathway inhibitors and activators, and methods and compositions for screening compounds which will modulate the interactions of the various compositions identified: ARC, RICK, and the CIDE family of activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening caspays for agents, useful in the diagnosis, prognosis or treatment of disease associated with excess cell growth and dysregulation of apoptosis. Complexes containing RICK and CLARP can be used in drug screening assays to identify inhibitor molecules blocking CD95-mediated apoptosis. Ownerexpression of ARC in an in vitro cell system can be used to therapy treatment of disease with increased cell death in muscle tissue and candiac disorders. Therapeutic ocmpositions of CIDEs can be useful for the enzymatic activity of caspase-B.

Identify inhibitors of the enzymatic activity of caspase-B.

Identify inhibitors of the enzymatic activity of caspase as the candiac disorders. Therapeutic compositions of CIDEs can be useful for user decided to a cancer, AIDS, neurodegenerative disorders, aplastic anemia, ischaemic injury, and toxin-induced liver disease. AntiRICK antibodies can be used as reagents for the preparation or affinity chromatography media, and for diagnostically measuring RICK levels. A specific inhibitor of an essential step in the biochemistry of apoptosis is needed. RICK interaction with intreacellular factors such as CLARP and FADD appears to be essential for apoptosis, inhibitors of RICK block of intracellular apoptosis factors are potential dractors are potential dractors are potential dractors of intracellular apoptosis factors are potential dractors of intracellular apoptosis factors are potential dractors of intracellular apoptos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is a fragment of the human RICK (RIP-like interacting CLARP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                694

This invention describes the isolation of novel human caspase recruitment domain, CARD-3 and CARD-4 polynucleotides and proteins and a partial curvine CARD-4. protain and genes. The genes and proteins of the invention are involved in the regulation of caspase activation. The caspase and recruitment domain (CARD) polynucleotides, polypeptides, homologues and cartivodies can be used in screening assays, detection assays, predictive methods may be used to disponse and treat patients which are suffering from a disorder associated with abnormal level or rate of apoptotic cell death, abnormal activity of the TNF receptor complex, or abnormal activity of a caspase. Co death, abnormal activity of the TNF receptor complex, or abnormal activity of a caspase. Diseases that may be treated include cancer (particularly follicular lymphoma, carcinomas associated with mutations in p53 and hormone-complex, autoimmune disorders (e.g. systemic luqus arcinomas associated with mutations in p53 and hormone-complex, immune-mediated glomerulonephritis), viral infections, although an application of disease, parkinson's disease, amyorizophic lateral sclerosis, retinitis pigmentosa, spinal muscular dystrophy, cerebellar degeneration, anaemia, myelodysplastic syndrome, myocardial infarction, and stroke. CC CARD-3 protein interacts with other cellular proteins and so can be used for regulation of cellular proliferation and differentiation and survival. The CARD proteins may also be used to for screen drugs or compounds which modulate their activity. The CARD-4 gene can express a long transcript that encodes CARD-45 and CARD-47 and CARD-47. This sequence compounds which modulate a protein a short transcript that encodes CARD-45 as a short transcript that encodes CARD-45 are the method of the encodes CARD-45 are the method of the encodes CARD-47 and cARD-47. This sequence

The present sequence is that of human caspase recruitment domain 3 (CARD-3), an intracellular protein predicted to be involved in regulating caspase activation. The sequence is predicted from an isolated CDNA clone (see AAF30001). Methods of diagnoshing and treating patients suffering from a disorder associated with an abnormal level or rate of apoptotic cell death, abnormal activity of the Fas/APO-1 receptor complex, abnormal activity of the two activity of the two and activity of the present activity of capase involve administering a compound that modulates the expression or activity of CARD-3, CARD-4, CARD-5 or CARD-6 e.g. using gene therapy methods. Such disorders include cancer, viral infection, autoimmune disorders, neurological diseases, haematological disorders, inflammancory disorders and immune disorders. CARD-3, CARD-4, CARD-3, CARD-4, CARD-5 or CARD-6 or CARD-6 or CARD-6 or CARD-6, or using continumned the used to regulate cell prodiferation, cell survival and cell growth. They can also be used to screen drugs or compounds that coll growth activity or expression and to treat disorders associated with insufficient or excessive production of CARD-3, -4, -5 or -6 protein, or production of an aberrant protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated intracellular proteins predicted to be involved in regulating caspase activation are used for diagnosis and treatment of e.g. cancer, viral infections, autoimmune diseases, neurological diseases and

catermining the effect of the test compound on the activity of the polypeptide to identify a compound which modulates the polypeptide. The method may be adapted for identifying a compound which binds to the LRR (leucine rich repeat) domain of CARD-4. Also included is a method of identifying a candidate compound for modulating LPS (lipopolysaccharide) equal texpressing a polypeptide compound for modulating LPS (lipopolysaccharide) activation of nuclear factor-kappa B (NF-kB), by providing a calivation of nuclear factor-kappa B (NF-kB), by providing a carly activation, where altered NF-kB activation polypeptide in the presence of the test compound indicates that the test compound is a candidate compound for modulating LPS-mediated activation of NF-kB. Modulators identified by complete or treating a disorder characterised by aberrant CARD-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein of interest or diagnose disorders such as cancer, viral infections, autoimmune disorders e.g. systemic lupus erythematosus, infections, autoimmune disorders e.g. systemic lupus erythematosus, as multiple sclerosis, Hashimoto's thyroiditis, atopic conditions such as thina, allergy, psoriasis, contact dermatitis, gastrointestinal allergies, insulin-dependent diabetes, bacterial infections, including tuberculosis, and lepromatous leprosy, disorders of cell signalling and disorders of tissues. The present sequence represents human CARD-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         472
